Backyard Buffer Resources

General Buffer Information

Forest Buffer Toolkit: Replanting Pennsylvania’s Streamsides. The purpose of this toolkit is to provide information for planning, design, establishment and maintenance of a streamside forest buffer. A copy of the Toolkit can be viewed at www.dep.state.pa.us/dep/deputate/watermg/wc/subjects/StreamRel/leaf/ tkit_TOC.pdf

Riparian Buffer Systems is a series of 10 fact sheets that includes plant lists, maintenance, and benefits and costs of a buffer. The fact sheets can be found at www.riparianbuffers.umd.edu/

Technical Assistance

Soil Test Kits can be purchased at your county Cooperative Extension office. The phone number can be found in the blue pages of your telephone directory under ‘County Government’. A list of Garden Centers and Nurseries that carry a large selection of native plants can be found in the “resources” section at www.envirolandscaping.org or contact Audubon Pennsylvania at (717) 787-3444.

Invasive Plant Identification and Control

The Nature Conservancy’s website gives an excellent overview of the harmful invasive plant species threatening wildland biodiversity, many coming from our own backyards. This site has extensive resources on weed control plus a photograph archive. http://tncweeds.ucdavis.edu/

Invasive Plants in Pennsylvania (brochure) describes the characteristics and impacts of invasive plants and provides tips to minimize their impact. Contact PA DCNR-Ecological Services at (717) 787-3444.

Rain Gardens

Virginia Department of Forestry has an excellent web page on rain gardens. http://www.dof.state.va.us/rfb/ riparian/rain_gardens

Plant Identification

A list of Garden Centers and Nurseries that carry a large selection of native plants can be found in the “resources” section at www.envirolandscaping.org or contact Audubon Pennsylvania at (717) 213-6880.

Backyard Buffers

What are buffers and what do they have to do with me?

If you own property along a stream, river, lake, or wetland, then you could be the proud owner of a backyard buffer. These buffers of native plants (rather than lawn) create habitat for wildlife and improve water quality by filtering and slowing the water that drains off your property. Excess water that runs off lawns, adjacent roads and sidewalks during rain storms can pick up sediment (soil), toxics (pesticides) and nutrients (fertilizers) that may have been applied to the landscape. These three pollutants can impact the health of local waterways and, ultimately, a larger area such as the Chesapeake Bay.

To learn more about the benefits of backyard buffers check out http://www.cnj.org/buffers/Introduction.pdf.

What does a buffer look like and how does it work?

Visualize a buffer in three zones. This will help you with planning and long-term maintenance of the buffer.

Streamside is located from the edge of the water to the top of the bank. Trees and shrubs will help to control bank erosion and provide vital habitat for wildlife.

Middle is the zone that contains trees and shrubs plus wildflowers and grasses. This area can be great for wildlife habitat, or possibly alternative forestry products such as nuts, berries, fruit and mushrooms. Trees may be removed and replaced on occasion.

Outer is the area that adjoins the rest of your yard and functions best with when planted with dense native grasses and wildflowers. This zone must be maintained to promote maximum nutrient uptake and sediment filtering.

The wider the overall buffer, the greater the benefits for wildlife and water quality.

To learn more about buffer zones and recommended widths visit http://www.abe.msstate.edu/Tools/csd/ NRCS-BMPS/pdf/streets/bank/riparianzone.pdf

How do I get started?

First Step

If you are mowing to the edge of the waterway or wetland stop! Change your mowing line to begin fifteen feet back from the top of the bank and allow the grass to grow as a roughcut lawn (4 – 6”). You may want to check local weed ordinances and your homeowners association policy for rules about allowable height, especially if this area is in public view.

Determining Buffer Size

Next engage your family and/or your neighbors by taking a walk with them along the stream including above and below your property to see what may be growing in the buffer area and if the banks are eroded (exposed soil). If the banks are actively eroding then professional assistance will be needed for bank stabilization before any planting can be done.

After the walk, outline the proposed buffer area on your property with rope, flagging or spray paint. Ask the following questions:

- Will there be room for recreation outside of the buffer area for people and pets?
- Will the proposed area be manageable to maintain for the next three years until it is established? You can begin small and, in time, add on.

Finalize the area of your buffer, measure it and take note of plants and wildlife and its usage (i.e. birds and nests, animal tracks, butterflies, etc.).

(Continues inside)
Planning Your Buffer

Using a piece of graph paper, hand draw the proposed area include the waterway and existing plants. It doesn’t need to be fancy - just something to use as a tool to help finalize your buffer plan. Research the native plants that you would like in your buffer, the list in this document should get you started. You could also visit a local natural area or state park to see what is growing in the same conditions as your buffer (sun/shade, wet/dry, etc). Make a list of the plants that you like and determine where they should go using the drawing. You may want to use different sizes of circles to show trees, shrubs, grasses, flowers by using various coins. If you wish to maintain views of the water from the house, take into consideration the mature height, width and location of the plant.

A soil test done by Cooperative Extension (listed in the blue pages of the phone book) will also help in selecting the right plant for your buffer. This test will tell you if the soil is alkaline or acidic along with other nutrient information for your site. Your proposed buffer may have different soils in different locations because of imported fill so take samples from 2 or 3 areas.

During the planning process check the property map for public utility right-of-ways (sewer, electric, natural gas, etc.) in your proposed buffer zone. If this map is not available or you not sure of location, a good resource is PA One Call at 1-800-242-1776. If utilities are present, you may need to plant wildflowers rather than trees or shrubs in the right-of-way.

If you purchased a piece of streamside property and plan to build a house on it, minimize the area to be cleared in the buffer zone. It will reduce the amount of soil exposed by construction that could wash into the waterway.

For further information on planning your buffer go to www.environlandscaping.org.

What’s next after planning?

After completing the planning process, you are ready to get “down and dirty.” The key to a long-lived buffer is proper site preparation. First, identify and remove all invasive, non-native vegetation from the site. Common invasive plants in streamside sites are multiflora rose, mile-a-minute vine or Japanese honeysuckle. If a large expanse of soil is exposed after removing the weeds, you may want to plant a cover crop such as annual rye to help prevent growth of new weeds or use weed mats or landscape fabric.

For additional information on invasive plants, www.bhwp.org/native/invasive_plants.

Where can I find the appropriate plants?

Local garden centers and retail nurseries should sell most of the plants listed in this document.

Now that the buffer is planted, will it take care of itself?

Unfortunately, no landscape is maintenance-free. The first year is the most critical. To ensure plant establishment and long-term survival, watering is key as well as keeping tall grass and weeds away from the new plants. An application of composted mulch four-inches deep will help retain moisture and hinder weed growth. Keep mulch from touching the base of the plant. Continue weed control by hand pulling and mowing, until the trees and shrubs are established in approximately three years. Over time, trees and shrubs will grow tall and wide to form a canopy that will shade out most of the grass and weeds underneath. In the long run, the least care is the best care for this landscape. You may want to avoid working in the buffer zone between mid-April to mid-August if wildlife is using the buffer to mate and raise young. Disturbance during this time can be detrimental.
Backyard Buffer Design Ideas

This is a conceptual design of what a backyard buffer may look like in a residential setting. It is not drawn to scale but shows the proper plant placement in the landscape based on water needs. When planning your buffer keep in mind the ultimate spread and size of the plant that you select.

By the footbridge...
Bridges are considered temporary structures; bridge f oters should make a minimal impact to the riparian area.

Steep slopes...
Native trees and shrubs help hold the soil via deep root systems, provide shade and essential food supply for the stream critters. These plants should not be removed from this zone.

Eroded banks...
Banks with exposed soil make it difficult to support vegetation and do not provide a buffer for pollutants such as eroded soil, chemicals and fertilizers that enter the waterway from stormwater. If these areas need stabilized contact an expert for advice.

Floodplains and Wetlands...
Areas often located along a waterway or lakeshore that slow and filter rainwater and provide necessary recharge of groundwater. Vegetation such as native trees, shrubs, wildflowers and grasses should be preserved and/or replanted.

Rain Gardens...
Are natural ways for you to help settle local stormwater pollution. These gardens are specially designed to receive runoff from paved surfaces (rooftops and driveways) at each home site allowing it to slowly soak into the ground.

LT - Large tree
ST - Small tree
LS - Large shrub
SS - Small shrub
ES - Evergreen shrub
GC - Ground cover
Beneficial Plants for Backyard Stream Buffers

This plant list is a guide to help you install your landscape plan. There are many more native plants that are suitable for Backyard Buffers. Be careful to avoid invasive plants. Consult native plant lists for your region or your local nursery or agricultural extension agent for additional plants which may fit into your landscape.

**Backyard Buffers**

What are buffers and what do they have to do with me?

If you own property along a stream, river, lake, or wetland, then you could be the proud owner of a backyard buffer. These buffers of native plants (rather than lawn) create habitat for wildlife and improve water quality by filtering and slowing the water that drains off your property. Excess water that runs off lawns, adjacent roads and sidewalks during rain storms can pick up sediment (soil), toxics (pesticides and nutrients) and fertilizers that may have been applied to the landscape. These three pollutants can impact the health of local waterways and, ultimately, a larger area such as the Chesapeake Bay.

To learn more about the benefits of backyard buffers check out http://www.cjc.org/buffers/Introduction.pdf.

What does a buffer look like and how does it work?

Visualize a buffer in three zones. This will help you with planning and long-term maintenance of the buffer. Streamside is located from the edge of the water to the top of the bank. Trees and shrubs will help to control bank erosion and provide vital habitat for wildlife. Middle is the zone that contains trees and shrubs plus wildflowers and grasses. This area can be great for wildlife habitat, or possibly alternative forestry products such as nuts, berries, fruit and mushrooms. Trees may be removed and replaced on occasion. Outer is the area that adjoins the rest of your yard and functions best with when planted with dense native grasses and wildflowers. This zone must be maintained to prevent maximum nutrient uptake and sediment filtering. The wider the overall buffer, the greater the benefits for wildlife and water quality.

To learn more about buffer zones and recommended widths visit http://www.abe.msstate.edu/Tools/csd/NRCS-BMPS/pdf/streams/bank/riparianzone.pdf

How do I get started?

First Step

If you are mowing to the edge of the waterway or wetland stop! Change your mowing line to begin fifteen feet back from the top of the bank and allow the grass to grow as a roughcut lawn (4 – 6”). You may want to check local weed ordinances and your homeowners association policy for rules about allowable height, especially if this area is in public view.

Determining Buffer Size

Next engage your family and/or your neighbors by taking a walk with them along the stream including above and below your property to see what may be growing in the buffer area and if the banks are eroded (exposed soil). If the banks are actively eroding then professional assistance will be needed for bank stabilization before any planting can be done.

After the walk, outline the proposed buffer area on your property with rope, flagging or spray paint. Ask the following questions:

• Will there be room for recreation outside of the buffer area for people and pets?
• Will the proposed area be manageable to maintain for the next three years until it is established? You can begin small and, in time, add on.

Finalize the area of your buffer, measure it and take note of plants and wildlife and its usage (i.e. birds and nests, animal tracks, butterflies, etc.). (Continues inside)
